About Crossbeam

Crossbeam is a partner ecosystem platform that helps companies build more valuable partnerships. It acts as an escrow service for data, allowing companies to find overlapping customers and prospects with their partners, while keeping the rest of their data private and secure. Their collaborative intelligence platform allows B2B companies to securely share their data to strengthen alliances, enable go-to-market teams, and better serve their customers.

The Challenge

Chris Castaldo, Crossbeam CISO, and his team are committed to keeping their business, customers, partners and, most importantly, their data safe from cyber threats. The team sought a single solution that could show exactly who and what has access to data, put guardrails around that data, and ultimately could ensure protection of data against cyber threats. They had processes in place to do this arduous task manually, but it required the use of valuable time, money, and resources that could be reallocated to other critical business tasks. They needed a robust data security posture management (DSPM) solution that could tell them at any time where their data was, who had access to it, and what it was being used for.

The Goal

The team's ultimate goal was to ensure all their data was protected, while also having the ability to see who has access to what data at any given time. This was especially important for SOC2 audits. They also wanted to be able to determine, from a hacker's point of view, which of their applications could be compromised. They had evaluated products that could determine some of this from an outside perspective, but they wanted something that really started from the inside—that is, security from the data out. Why wait for a cyber threat actor to get to the data before deploying protections? Crossbeam wanted a product that started with data protection.

The Choice

Chris and his team evaluated a few different data security posture management solutions before selecting Symmetry Systems' DataGuard. The other companies that the Crossbeam team looked at viewed data security from the outside in—that is, from the perimeter—to defend against attacks, rather than approaching security based on the attacker's main objective—the data. For Crossbeam's AWS cloud environment, DataGuard fit perfectly into their "security-from-the-data-out" ideology. Chris and the Crossbeam team saw the immediate benefit to a solution that offered improved data visibility, reduced data sprawl, and helped the Crossbeam security team prioritize their data security risks.

The Outcomes

One of the greatest challenges DataGuard has solved for Crossbeam is the ability to see how data was being used and who was using it. Prior to deploying DataGuard, Crossbeam had no automated way to monitor data access and activity—everything was time and resource intensive. With DataGuard, Crossbeam can easily show auditors who accesses which data, how much privileged access they have, and if there are any errors in the data. The solution offers high, precise visibility into what is happening to the data.

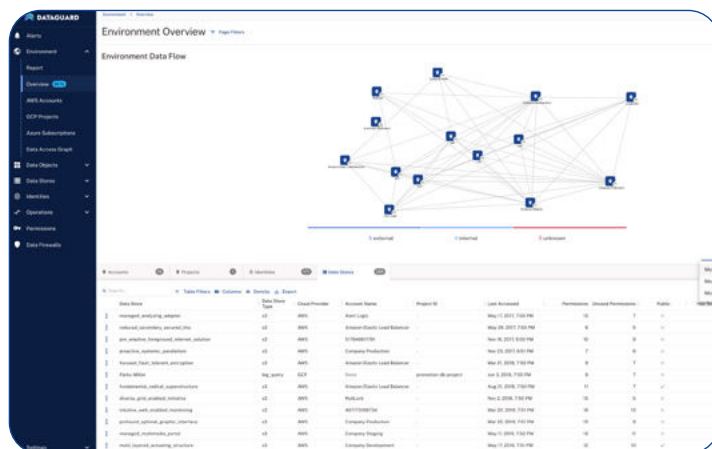

After deployment and at the request of Crossbeam, Symmetry Systems used DataGuard to look for system weaknesses. According to Chris, during the test, the moment someone tried doing something they weren't supposed to, DataGuard alerts for anomalous behavior were triggered, demonstrating DataGuard's full capacity to actively and accurately protect the organization's data.

About Symmetry Systems DataGuard

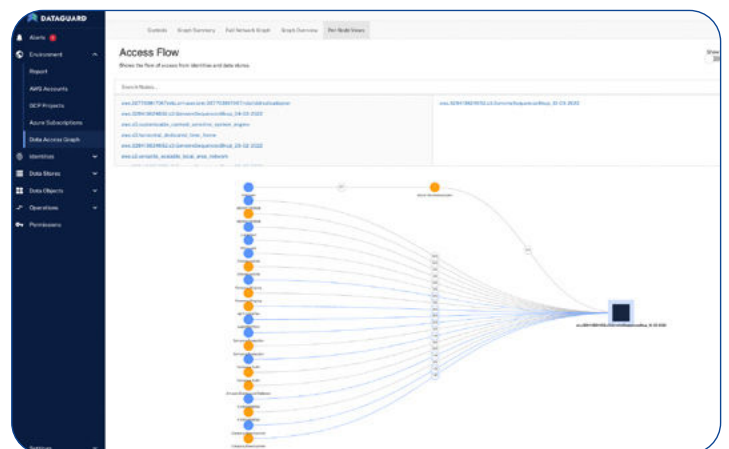

Symmetry's DataGuard is a hybrid cloud, data security solution that provides a data-centric approach to enable organizations to map, secure and track identity, permissions, and data flows—**at scale in multi-cloud environments**—while providing unified visibility across these environments for cloud—and information security teams.

DataGuard provides a cloud **Data Security Posture Management (DSPM)** solution that unifies visibility into data objects across all data stores, answering data security and compliance questions that **traditional cloud security tools cannot**. For example, what data is affected by a compromised credential, or an exploited web-service, or an off-boarded analyst?

DataGuard enables cloud and security operations to understand and systematically control data risk—**defining the path to zero trust for data**—while baking in compliance and incident response. DataGuard provides actionable insights into your data flow, unlike the traditional, static views offered by legacy technologies.

Top-down view into your data environments: filter by most Data Stores, Permissions or Identities.

Easily track data flows: both in and out of your environments with high accuracy.

Supports a variety of integrations out of the box: so you can track IAM, Alerts and Evidence.

Vast cloud provider support: Amazon Web Services, Microsoft Azure, Google Cloud, on-premise environments.

Crossbeam Visualization

“What sets DataGuard apart? Telling me about a problem is 1x value, but showing me the problem and then actually fixing it, that is 10x value, and that’s what DataGuard provides. **The value we get out of it is much higher than what we spend on it.**”
